

Name: P.Moshiya

Reg No:192572142

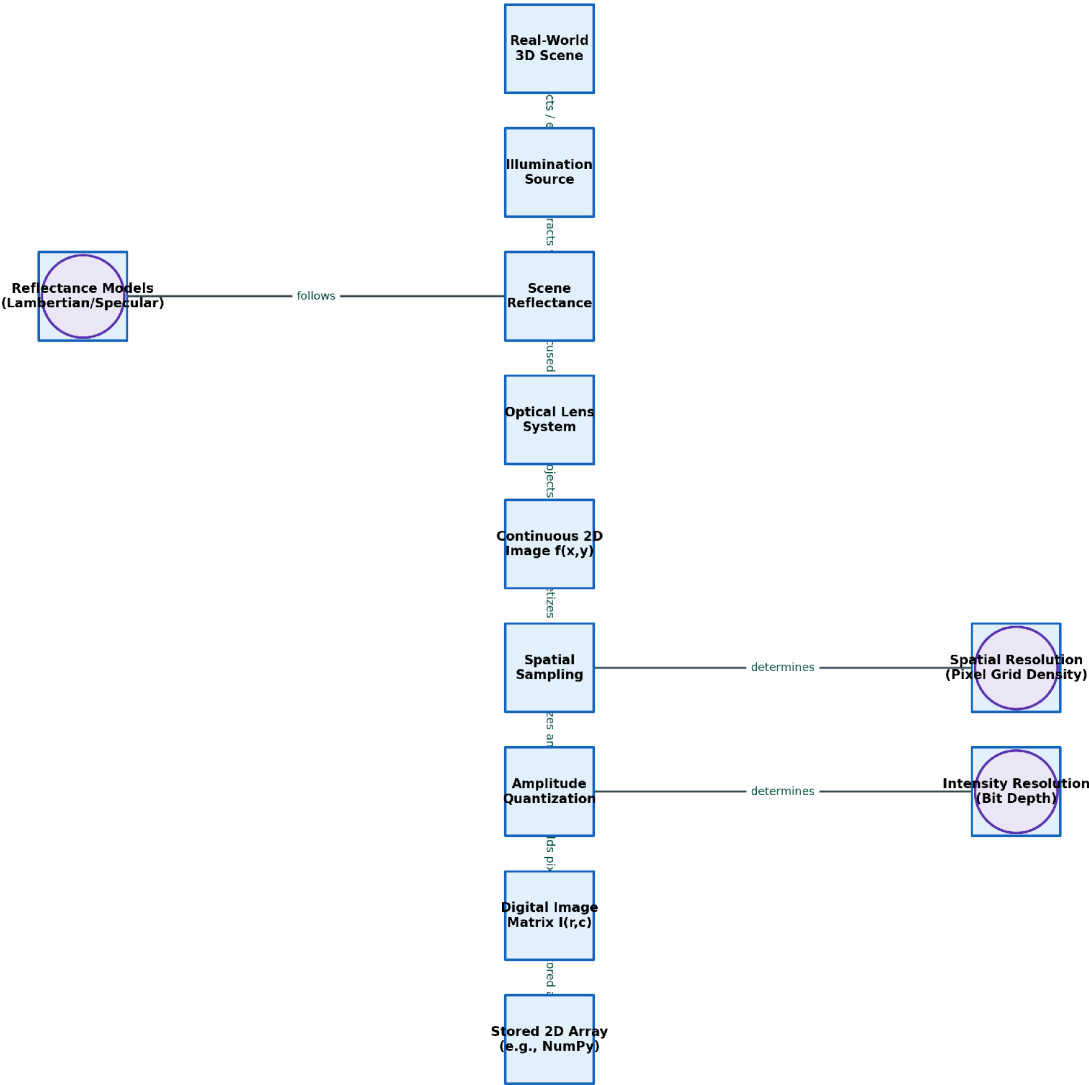

Course:Computer Vision

Code:ITA0502

Question 1: Real-World Scene Capture Pipeline

1. Concept Hierarchy Framework

Q1: Real-World 3D Scene to Digital Image Representation Pipeline

2. Relational Linkage Matrix Table

Source Node	Linking Phrase / Relationship	Target Node
Real-World 3D Scene	reflects light emitted from	Illumination Source
Real-World 3D Scene	projected onto focal plane via	Camera Optics System

Camera Optics System	governed geometrically by	Thin Lens Model
Thin Lens Model	maps 3D coordinates to	Continuous Image Plane
Continuous Image Plane	excites pixel sites across	Sensor Array (CCD/CMOS)
Sensor Array (CCD/CMOS)	converts photon flux into	Analog Electrical Signal
Analog Electrical Signal	discretized spatially by	Spatial Sampling
Analog Electrical Signal	discretized in amplitude by	Intensity Quantization
Spatial Sampling & Quantization	generates the discrete numerical	Digital Image Matrix $I(x,y)$

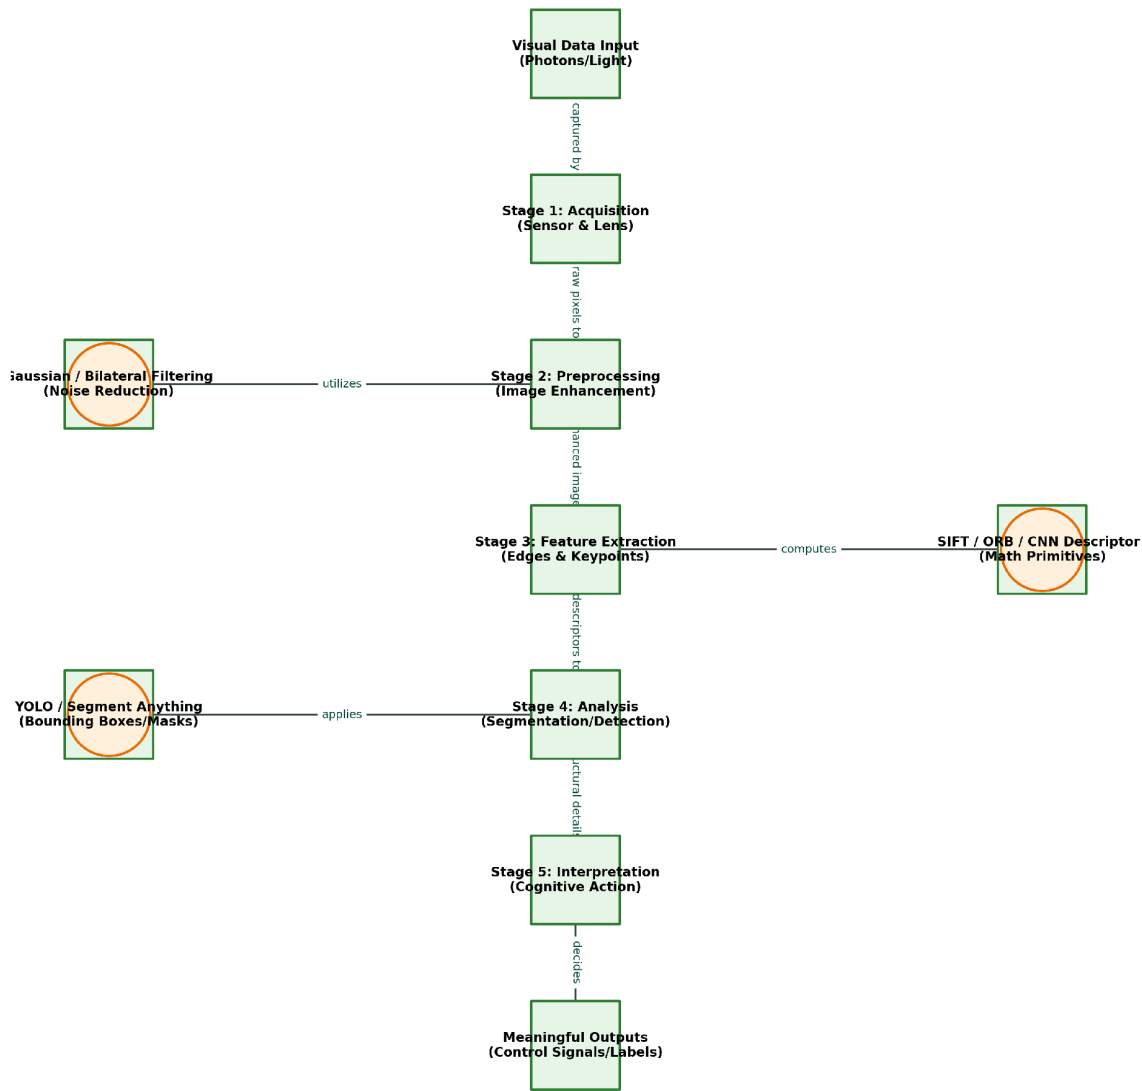

3. Literature Integration & Theoretical Validation

- **Horn & Brooks (Radiational Physics Foundations):** Formulates light radiance metrics converting to continuous image plane irradiance values.
- **Gonzalez & Woods (Digital Signal Discretization):** Validates coordinate bounds governing spatial discrete mapping configurations.
- **Szeliski (Computer Vision Geometric Principles):** Structures geometric projection constraints leveraging homogeneous linear spatial transform equations.

Question 2: Visual Data Handling Pipeline Stages

1. Concept Hierarchy Framework

Q2: Sequential Visual Data Handling Stages in Computer Vision Systems

2. Relational Linkage Matrix Table

Source Node	Linking Phrase / Relationship	Target Node
Visual Data Handling Pipeline	initiates execution with	Data Acquisition

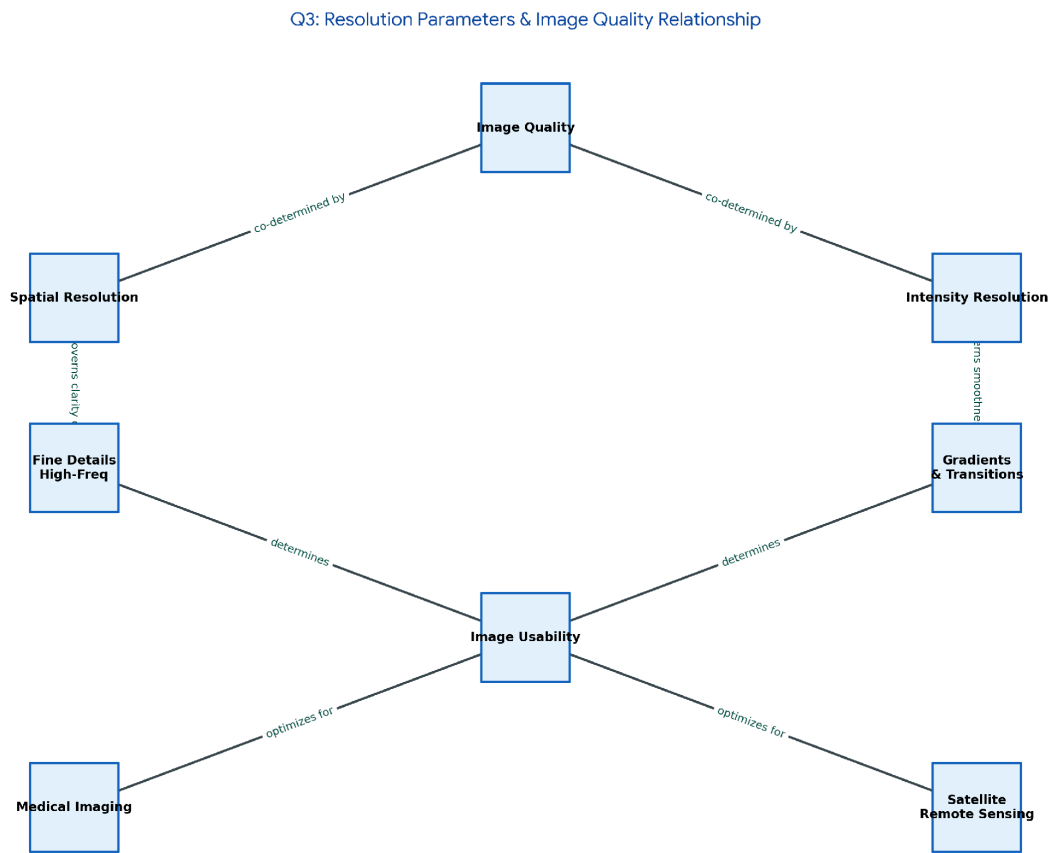

Data Acquisition	streams raw uncompressed frames to	Image Preprocessing
Image Preprocessing	improves Signal-to-Noise Ratio via	Noise Filtering (Gaussian/Median)
Image Preprocessing	rectifies illumination deviations via	Histogram Equalization
Image Preprocessing	delivers clear normalized matrices to	Feature Extraction
Feature Extraction	isolates invariant primitive landmarks	Edges, Corners & Descriptors (SIFT/HOG)
Feature Extraction	provides engineered input vectors to	Semantic Analysis
Semantic Analysis	executes high-level localization via	Object Detection & Classification
Semantic Analysis	feeds contextualized metadata into	Interpretation Stage
Interpretation Stage	outputs operational instructions for	Decision Output Systems

3. Literature Integration & Theoretical Validation

- **Lowe (Scale-Invariant Structural Keypoints):** Standardizes continuous spatial point mapping shifts into scale-invariant image vector points.
- **Dalal & Triggs (Gradient Histogram Configurations):** Proves edge gradient spatial tracking arrays increase human detection accuracy performance safely.
- **LeCun, Bengio, & Hinton (Deep Feature Automations):** Displaces classic pipeline stages with multi-layer automated convolutional representations.

Question 3: Image Resolution vs. Perceptual Quality

1. Concept Hierarchy Framework

2. Relational Linkage Matrix Table

Source Node	Linking Phrase / Relationship	Target Node
Digital Image Quality	is structurally bounded by	Spatial Resolution
Digital Image Quality	is tonally bounded by	Intensity Resolution
Spatial Resolution	governed mathematically via	Sampling Frequency (Nyquist Limit)
Spatial Resolution	dictates minimum feature distance inside	Pixel Density (PPI/DPI)

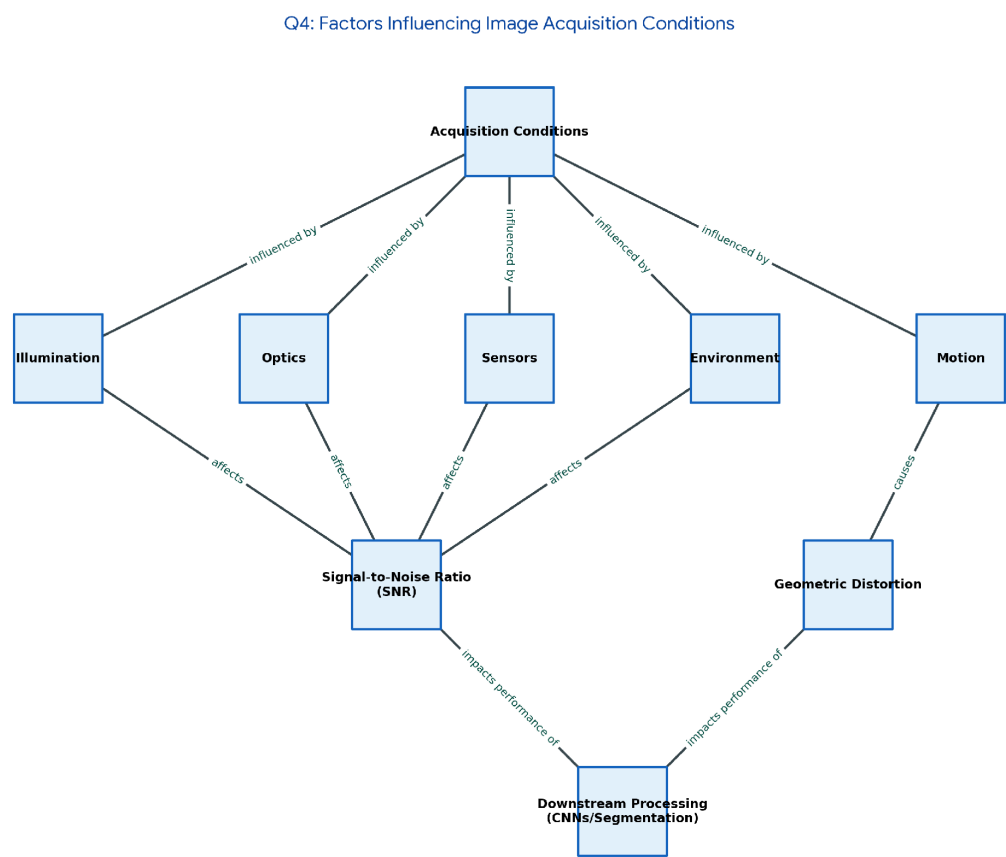

Spatial Resolution	insufficient levels induce	Spatial Aliasing / Pixelation
Intensity Resolution	controlled by analog-to-digital	Quantization Bit Depth (k-bits)
Intensity Resolution	insufficient levels induce	False Contouring / Posterization
Spatial Aliasing & False Contouring	collectively degrade overall semantic	Image Usability
Image Usability	establishes performance diagnostic safety in	Medical Imaging (X-Ray/MRI)
Image Usability	bounds target categorization confidence inside	Satellite Remote Sensing

3. Literature Integration & Theoretical Validation

- **Shannon (Nyquist-Shannon Uniform Sampling Law):** Formulates boundary limitations required to neutralize disruptive spatial sampling frequencies.
- **Wang et al. (Perceptual Structural Similarity Assessment - SSIM):** Evaluates degradation errors through human perceptual index structures over pixel variance math.

Question 4: Environmental & Acquisition Sensor Conditions

1. Concept Hierarchy Framework

2. Relational Linkage Matrix Table

Source Node	Linking Phrase / Relationship	Target Node
Image Acquisition Conditions	highly sensitive to changes in	Ambient Illumination
Ambient Illumination	extreme variations cause severe	Saturation & Contrast Loss
Image Acquisition Conditions	distorted internally by electronic	Sensor Characteristics
Sensor Characteristics	heat and silicon variations produce	Thermal & Shot Noise

Image Acquisition Conditions	degraded temporally by ongoing	Relative Scene Motion
Relative Scene Motion	long exposures open to dynamics yield	Motion Blur Artifacts
Image Acquisition Conditions	scattered physically by the external	Environmental Medium
Environmental Medium	particulate interactions produce	Atmospheric Haze / Fog Occlusion
Saturation, Noise, Blur, & Haze	corrupt data tracking vectors inside	Downstream Pipeline Stages
Downstream Pipeline Stages	induces catastrophic matching failures in	Edge Catching & Feature Trackers

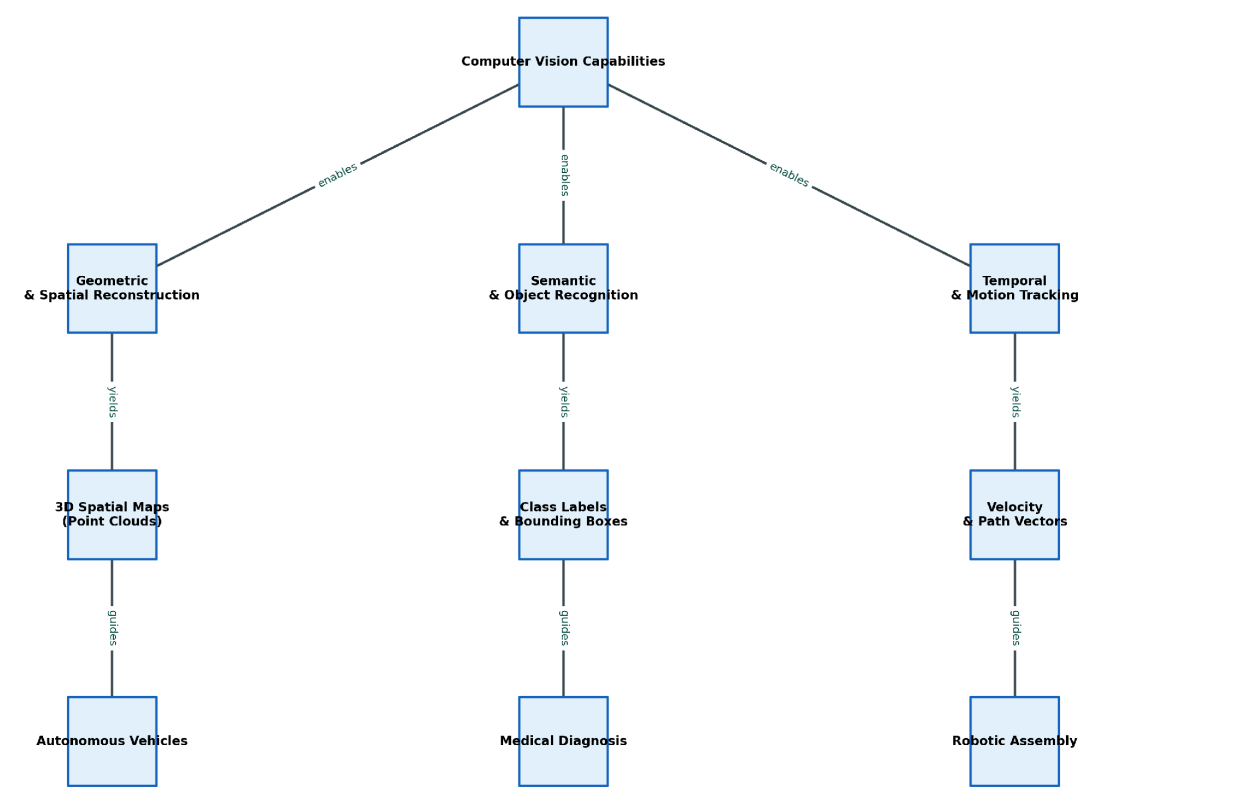

3. Literature Integration & Theoretical Validation

- **Lucas & Kanade (Differential Tracking Constraints):** Traces failure parameters when physical motion disrupts bright constancy assumptions.
- **He, Sun, & Tang (Haze Removal Optimization Systems):** Employs statistical scene priors to restore light attenuation loss caused by particulate interactions.

Question 5: System Capabilities vs. Target Verticals

1. Concept Hierarchy Framework

Q5: System Capabilities vs. Application Selection

2. Relational Linkage Matrix Table

Source Node	Linking Phrase / Relationship	Target Node
CV System Architecture Planning	matches target needs to	Algorithmic Execution Capabilities
Algorithmic Execution Capabilities	provides depth extraction via	3D Reconstruction & Stereopsis
3D Reconstruction & Stereopsis	enables spatial collision awareness in	Autonomous Vehicles

Algorithmic Execution Capabilities	provides continuous space tracking via	Temporal Object Tracking
Temporal Object Tracking	drives abnormal behavior detection for	Surveillance Infrastructure
Algorithmic Execution Capabilities	provides class boundaries through	Statistical Classification
Statistical Classification	identifies structural defects within	Industrial Metrology / Quality Control
CV System Architecture Planning	must adapt and optimize within	Operational & Computing Constraints
Operational & Computing Constraints	sets absolute hardware execution caps on	Edge Infrastructure (FLOPS/FPS)
Edge Infrastructure (FLOPS/FPS)	determines final production deployment safety in	Real-World Target Verticals

3. Literature Integration & Theoretical Validation

- **Redmon et al. (Single-Stage High-Velocity Detection Maps):** Charts the fundamental trade-off limitations connecting compute speed (FPS) directly to bounding box location accuracy.
- **Hartley & Zisserman (Projective Solid Epipolar Layouts):** Formulates rigid multi-view matrix math equations required to secure valid automated metrology measurements.
